

In this hands-on course students will learn essential skills to get the most out of their COMMANDperformance, data warehouse and Business Analytics application. Students will gain an understanding of the data warehouse contents, how the contents are populated and how to reconcile the data warehouse to their transactional system. Students will also learn how to customize the COMMANDperformance application to deliver information to their users in the most efficient and effective manner.

This course is an excellent predecessor to the COMMANDperformance: Reporting Authoring course, being offered on Day 2, where students learn to develop their own reports specific to the needs of their users.

### **COMMANDperformance Data Warehouse**

- Data warehouse schema
- Populating the Data warehouse content
